## How load (threads) is added in JMeter:

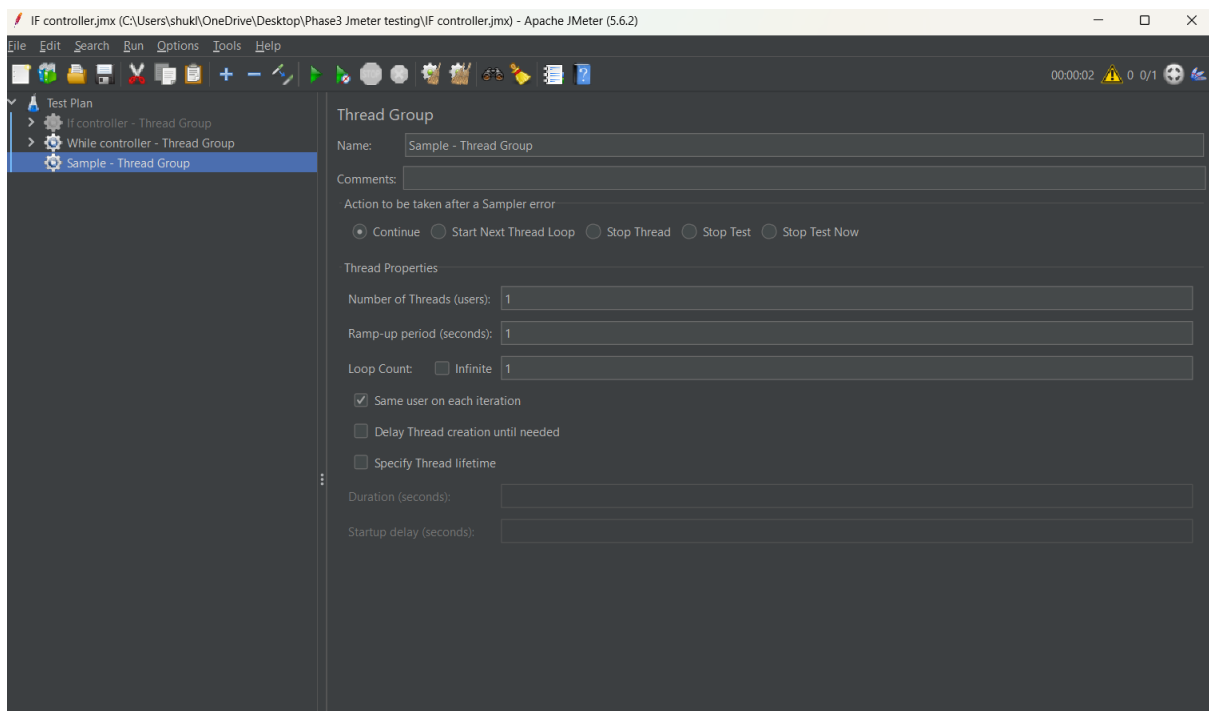

---

The below are the steps to add Threads in JMeter are given below:

Add thread group in Test Plan:

After clicking on Thread group we will be on below step:

In this step we can do any changes depending on needs

Here,

Number of Threads means (number of user which are going to execute test).

Ramp-up period means (Time by which number of user should be up)

Loop Count means (You can set the number of iterations for each user in the group using Loop Count.)

Start up delay means (To control the duration of each thread group and the after how much seconds it starts.)

Duration: (Total how many second all the user have to perform testing.)

Therefore by increasing number of threads we can increase load.
