

---

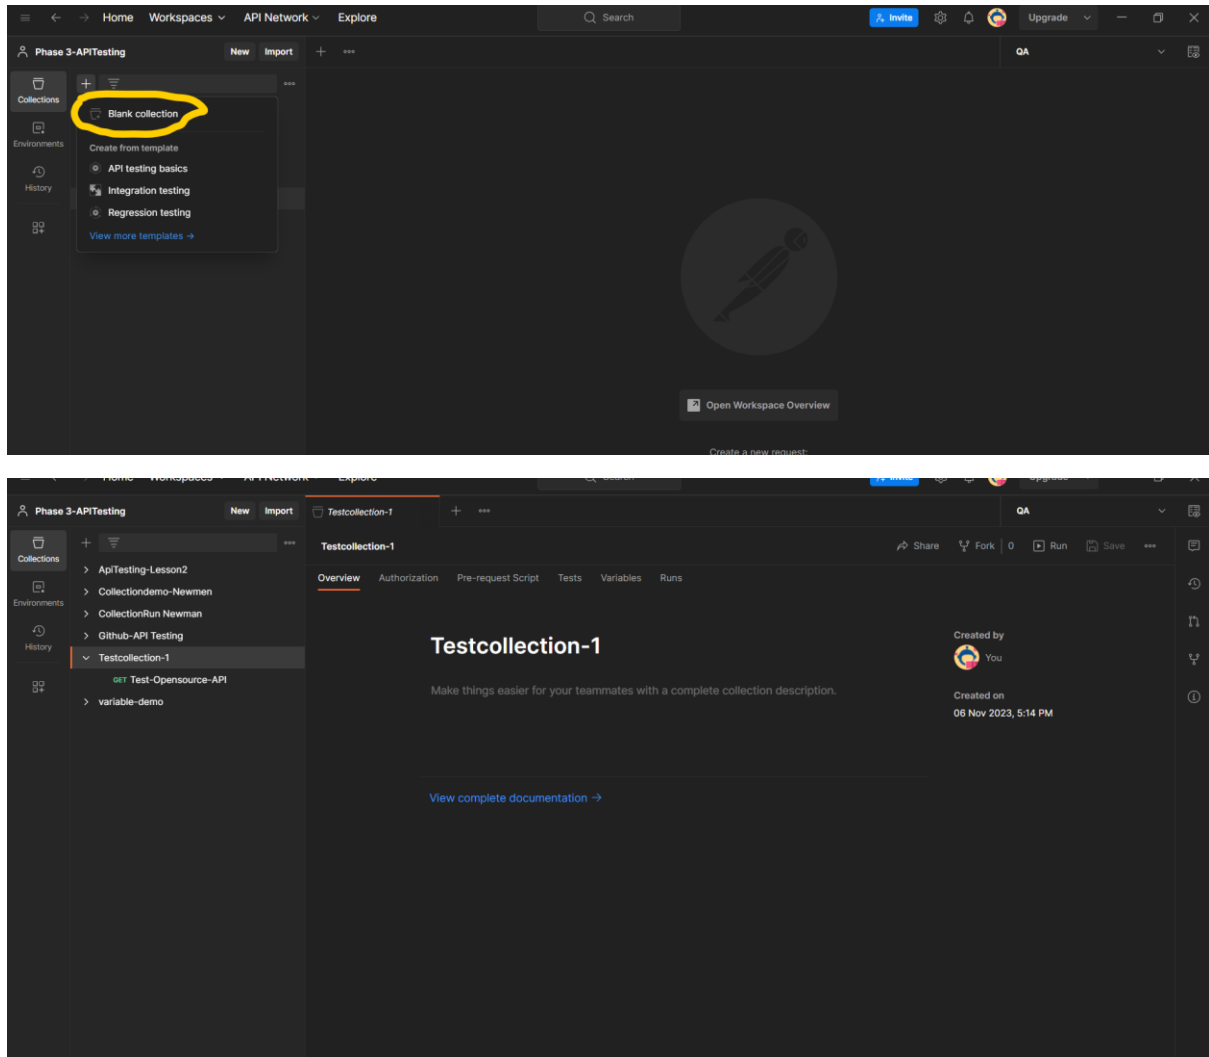

---

Create the first API request.

---

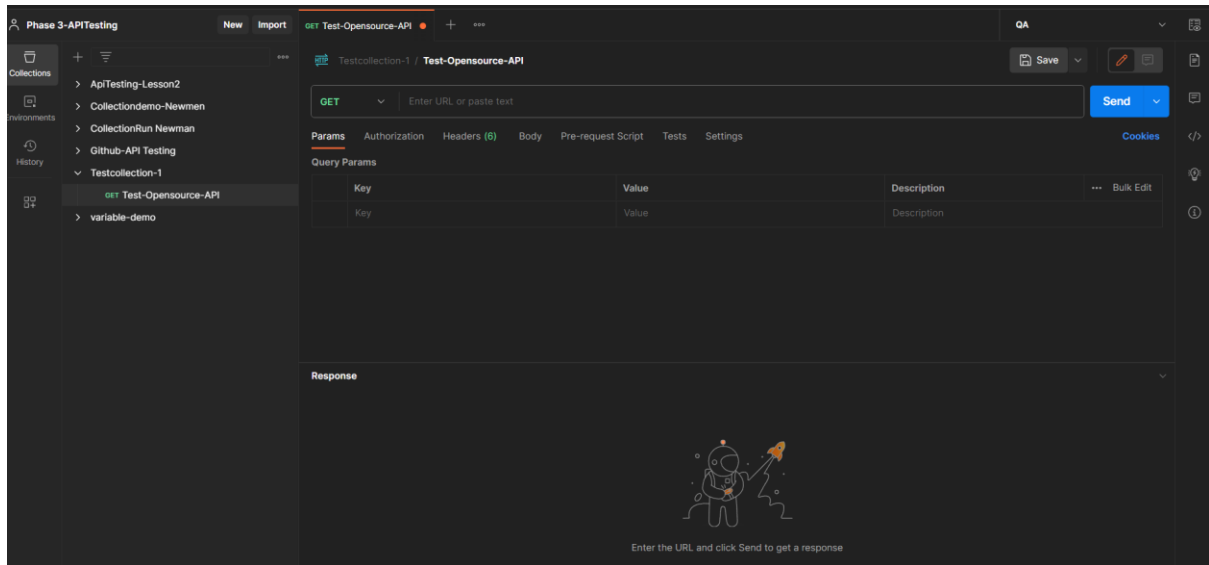

---

Step 1: first we will create a blank collection as shown below

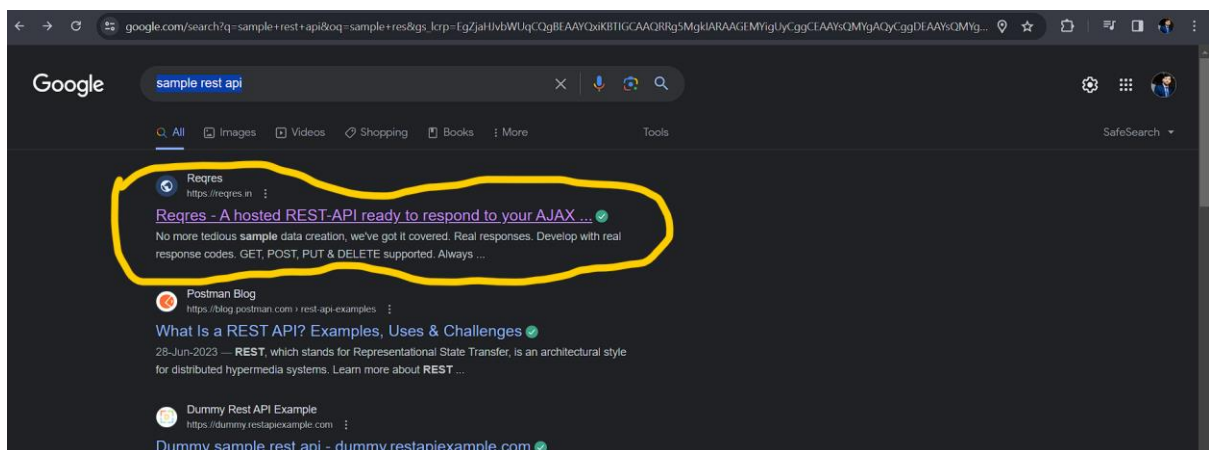

As above I had created a collection named as TestCollection-1

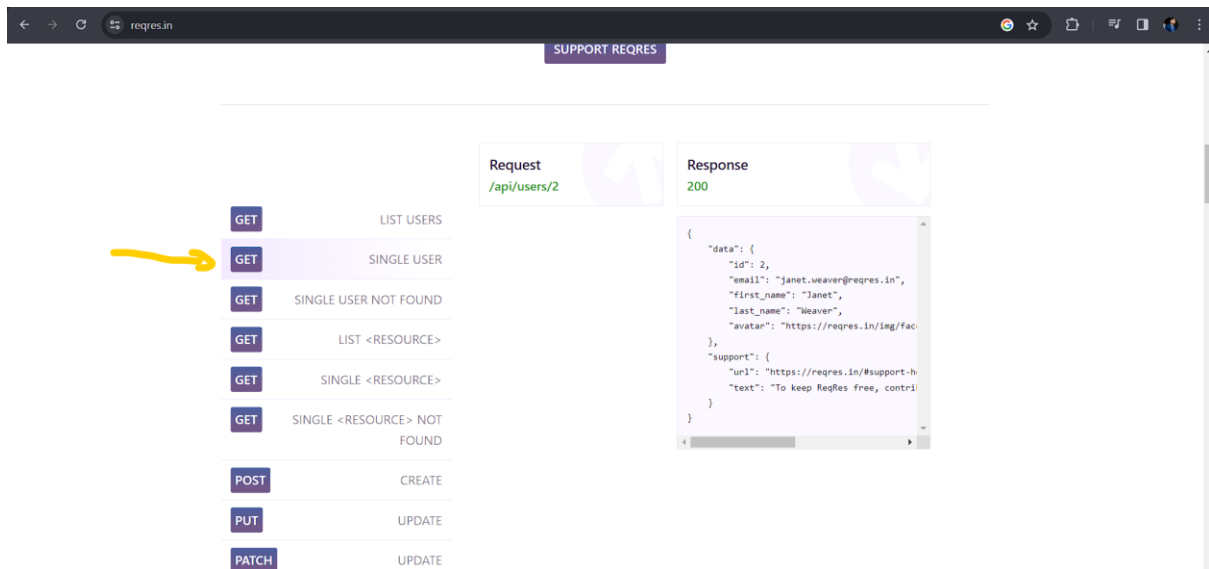

Now in next step we will right click on created collection and a side popup will occur from which we have to click on Add request as below.

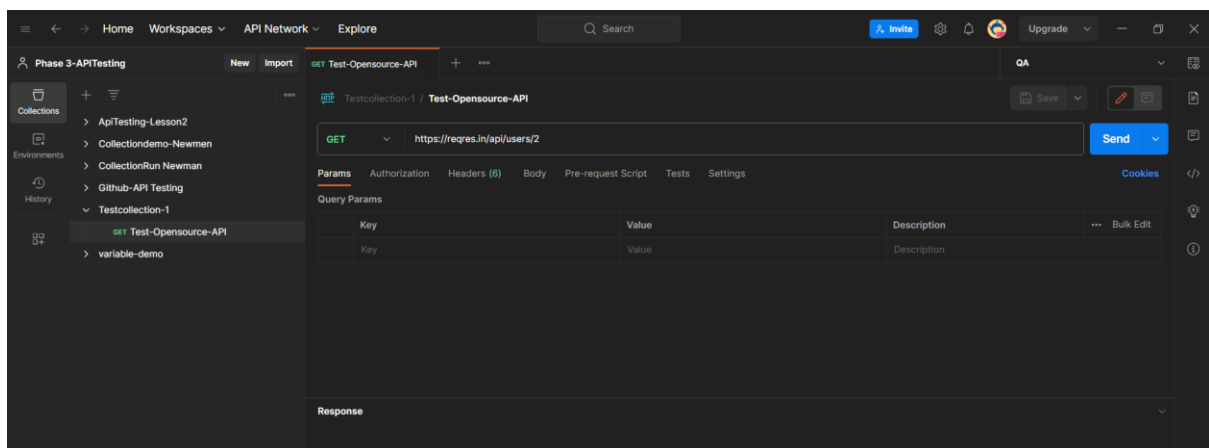

Step 3: Now we will search sample rest api on google and click on the link. So from this <https://reqres.in/> we will get some sample API for testing

From below we can take any of the API, but know I am taking Single user API

Next, we will copy the link and paste on Enter URL on postman <https://reqres.in/api/users/2> (the highlighted part is the request)

Then we will click on save and send So, we will get the response as shown below.
